

BOSKOS BROWSE MULCH

A complementary feed for exotic browsers

Features and Benefits

BOSKOS BROWSE MULCH is a combination of Acacia and high quality lucerne, produced in South Africa. Acacia is the natural fiber source of many exotic browsers. Therefore this product is an ideal addition to the diet of browsers in your zoo. It contains prebiotics and active fibers, that help maintain and improve animal's microbes in the gut.

Feeding Guide

Can be fed ad libitum or as the usual portion of browse in the diet. Ideally fed in a way that challenges the animal and increases the feeding time. For example using a feeder with a grid on top of it, to make it harder to reach the food and encourage the animal to perform natural behavior using the tongue. It is also possible to mix the pellets that are part of the diet of the animal with the browse mulch. This will increase feeding time, which can have a positive effect on digestion and nutrient availability. Note: the texture of this product is too fine to be fed in a hay net.
